

Forensic Tool

Years of email. Seconds to find.

Federal agencies and large organizations frequently are required to produce electronic records and documents, including email, by subpoena from a court or the legislature, a discovery request as part of the litigation process, or a request under the Freedom of Information Act. In addition, potential legal problems can arise when classified material spills into unclassified networks. Rather than waiting for a government or media inquiry, agencies must be proactive and identify potential issues before they become problems.

SAIC's TeraText Searchable Archive for Files and Email (SAFE) turns your email archive into an information resource with centralized management. The tool is designed so that authorized users can:

- Search the entire corporate email archive rather than having to examine every workstation to extract information
- Identify inappropriate activity early and then apply appropriate remedies — before an organization is exposed to risk
- Save searches and replay them periodically
- As new material comes in, notify other appropriate users of material that is potentially relevant to an investigation

Forensic Tool

TeraText SAFE provides a high-speed, precision search capability of email header fields (including addresses) and full-text content of email and attachments. TeraText SAFE stores email and attachments in their original format and can export them for evidentiary purposes or for ingestion into case management, e-discovery, or similar systems.

Low Impact to Existing Infrastructure

TeraText SAFE plugs into your existing email server and forwards all ingoing and outgoing email to the archive where it can be searched as a single collection. The process is transparent; it does not affect user interaction with the email server. Email is available for search within minutes of arriving at the email archive.

Fast Enterprise Search

For auditors, forensic users, IT administrators, or legal professionals, TeraText SAFE provides tools to search the entire email archive for patterns of behavior, inappropriate activity, or risk to the organization. The tool is designed to run searches manually, periodically, or every time the archive is updated to facilitate monitoring. Users can save their searches and email the results to nominated email accounts.

Federated Architecture

With TeraText SAFE, authorized users can search distributed archives as though they were a single archive. Its Web interfaces are secure. Local departments can control their own stores, or the enterprise can centralize the store – searching is the same either way. With this tool, users no longer need to manually locate email on multiple machines.

Key Benefits

- Tamper-resistant archive of sent and received email
- Real-time precision search capabilities to help identify potentially harmful activity
- A save-a-search feature that automatically alerts forensic users periodically or as a message arrives
- Access to messages as they are archived
- Export of messages and attachments in original format
- Reduction in search time, cost, and reliance on IT investigations, and space requirements

Capability	Benefits
<ul style="list-style-type: none">• Designed as a tamper-proof repository of all sent and received emails	<ul style="list-style-type: none">• Helps reduce time spent searching for information so employees can spend more time acting on it
<ul style="list-style-type: none">• Real-time search of email and attachments	<ul style="list-style-type: none">• Saves time for users
<ul style="list-style-type: none">• Authorized users can search the entire repository	<ul style="list-style-type: none">• Reduce need to involve IT in investigation
<ul style="list-style-type: none">• Features archive compression and deduplication	<ul style="list-style-type: none">• Helps reduce storage costs and increase retention capability
<ul style="list-style-type: none">• Stores email and documents in native format (but extracts contents for search)	<ul style="list-style-type: none">• Can use archived contents as evidence
<ul style="list-style-type: none">• Removes duplicate files, attachments, and emails	<ul style="list-style-type: none">• Efficient utilization of forensic user time
